FIRST G114.2.0 MW WIND TURBINE IN USA.

Gamesa, líder tecnológico global en la industria Gamesa, a global technology leader in the wind industry, has commissioned its first 60Hz G114-2.0 MW wind turbine prototype in the United States, in Texas.

The installation of the prototype was completed mid-March at the Reese Technology Center in Lubbock, triggering the start of the intensive process of validating and certifying the new turbine. The company expects to obtain type certification before the end of 2014.

This step in Gamesa's product strategy follows the installation of the company's 50Hz model G114-2.0MW prototype in Alaiz (Navarre, Spain), announced earlier this year. It has started to generate power.

The Gamesa G114-2.0 MW wind turbine is a standard-bearer in the sector due to its low power density. This new product contributes to one of the company's top priorities: significantly cutting the cost of energy of the wind turbines Gamesa designs for medium and low wind speed sites.

With a rotor spanning 114 metres, the turbine's swept area is 38% greater than that of the G97-2.0 MW, and produces 20% more energy a year.

The G114-2.0 MW wind turbine, designed to maximise the performance of turbines installed in less windy sites, is part of the company's 2.0-2.5 MW platform, whose track record encompasses the installation of more than 16 GW worldwide and an availability record of over 98%
